RESULT 7
138670
protein-tyrosine-phosphatase (EC 3.1.3.48), receptor type J precursor - human
N;Alternate names: density enhanced phosphatase-1 (DEP-1); protein-tyrosine phosphatase
C;Species: Homo sapiens (man)
C;Date: 01-Mar-1996 #sequence_revision 08-Mar-1996 #text_change 09-Jul-2004
C;Accession: 138670; 152599
R;Ostman, A; Yang, Q; Tonks, N.K.

 system
 kinase family. CSF-1/PDGF
 (By
 + a protein
Wen Y., Edelman J.L., De Vries G.W., Sachs G.;
Submitted (WAR-1997) to the EMBL/GenBank/DDBJ databases.
--- FUNCTION: Receptor for VEGF or VEGFC. Has a tyrosine-protein
kinase activity. The VEGF-kinase ligand/receptor signaling sy
plays a key role in vascular development and regulation of
vascular permeability (By similarity).
--- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + a proteit
tyrosine phosphate.
--- SUBCELLULAR LOCATION: Type I membrane protein.
--- SUBCELLULAR LOCATION: Type I membrane from thinase family. CSF-1/P
 (Potential).
 receptor subfamily.

Quinn T.P., Peters K.G., de Vries C., Ferrara N., Williams L.T.;

Quinn T.P., Reters K.G., de Vries C., Ferrara N., Williams L.T.;

Quinn T.P., Ranse I is a receptor for vascular endothelial growth
factor and is selectively expressed in vascular endothelium.";

Proc. Natl. Acad. Sci. U.S.A. 90:7533-7537(1993).

-I. FUNCTION: Receptor for VEGF or VEGFC. Has a tyrosine-protein

kinase activity. The VEGF-kinase ligand/receptor signaling system
plays a key role in vascular development and regulation of
vascular permeability.

-I. CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + a protein
 SUBCELLULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: Expressed at high levels in adult heart, lung, kidney, barain and skeletal muscle, but is also expressed at lower levels in most other adult tissues.
SIMILARITY: Belongs to the Tyr protein kinase family. CSF-1/PDGF
 "A receptor tyrosine kinase cDNA isolated from a population of enriched primitive hematopoietic cells and exhibiting close genetic linkage to c-kit."; Proc. Natl. Acad. Sci. U.S.A. 88:9026-9030(1991).
 "Cloning and functional analysis of the promoter for KDR/flk-1, a receptor for vascular endothelial growth factor."; J. Biol. Chem. 270:23111-23118(1995).

 This Swiss-Prot entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation - the European Bioinformatics Institute. There are no restrictions on its
 Printiple Production in the programment of the prog
 the European Bioinformatics Institute. There are no restrictions on its use as long as its content is in no way modified and this statement is not
 prays a new total in vascular development and regulation or vascular permeability.

-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + a protein tyrosine phosphate.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUB SPECIFFCITY: In all endothelial tissues during onset of vascularization. In later development, present in lung, heart, intestine and skin.
-!- DBVELOPMENTAL STAGE: Expressed in whole mesoderm at onset of gastrulation. From day 2, confined to endothelial tissues and expression continues to be widespread throughout vascularization until E9 where it becomes treatricted to specific regions such as the spinal chord and heart valves.
-!- INDUCTION: In vitro, it is induced by basic fibroblast growth factor (bFGF), uniquely in the first 24 hours of cell culture.
-!- SIMILARITY: Belongs to the Tyr protein kinase family. CSF-1/PDGF
 [4]
NUCLECTIDE SEQUENCE OF 1023-1079.

Marcelle C., Eichmann A.;
"Molecular cloning of a family of protein kinase genes expressed in the avian embryo.";
 the avian embryo.";
Oncogene 7:2479-2487(1992).
-!- FUNCTION: Receptor for VEGF or VEGFC. Has a tyrosine-protein
kinase activity. The VEGF-kinase ligand/receptor signaling syste
plays a key role in vascular development and regulation of

 tyrosine phosphate.
--- SUBCELLUAR LOCATION: Type I membrane protein.
--- TISSUB SPECIFICITY: Expressed in adult lung and liver, and in fetal liver, brain, intestine and placenta.
--- SIMILARITY: Belongs to the Tyr protein kinase family. CSF-1/PDGF receptor subfamily.
--- SIMILARITY: Contains 7 Ig-like C2-type (immunoglobulin-like)
 MEDLINE-93330572; PubMed-8393164; Innerty H., Kelleher K., Morris G.E., Bean K., Merberg D.M., Kriz Morris J.C., Sookdeo H., Turner K.J., Mood C.R.; Molecular cloning of murine PLT and PLT4.";
 activity.
CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + a protein
 "Chromosomal localization of FLT4, a novel receptor-type tyrosine
 Genomics 13:475-478(1992).
-!- FUNCTION: Receptor for VEGFC. Has a tyrosine-protein kinase

growth plays a Novel proteins that prevent dimerization of vascular endothelial factor receptors and for treating diseases in which the receptor role e.g. inflammation, cancer, diabetic retinopathy, psoriasis.

Claim 11; Fig 3; 83pp; English.

retinopathy, angiofibromas, endometriosis, macular degeneration, retinal This sequence represents the human KDR/Flk-1 protein. The invention relates to a protein comprising the amino acid sequence of the fourth immunoglobulin (Ig)-like domain of a vascular endothelial growth factor (VEGF) receptor or a variant of the protein that retains the ability to bind to a VEGF receptor. The protein, its functional equivalent and DNA encoding it are useful for treating a disorder whose parhology is dependent upon a VEGF family-mediated pathway, including inflammation, psoriasis, rheumatoid arthritis, haemangiomas, leiomyomas, diabetic

 (NP-1) receptor protein. One method comprises introducing a sample comprising the compound to the receptor protein and allowing the compound to bind to the complex. Signaling through VEGRR-2 is enhanced in the presence of the NP-1 co-receptor an enhods of the invention can be used for identifying novel pro- and anti-angiogenic compounds. The present sequence represents the human VEGFR-2 receptor protein

an angiogenic protein of the invention. The angiogenic proteins and the disease and to detect diseases, or susceptibility, by detecting mutations or the presence or amount of angiogenic protein expression. Particularly they are used to stimulate wound healing, growth of damaged bone and tissue, especially peripheral arterial disease, ratical limb ischaemia or coronary disease. Antagonists of the sequences are used to inhibit angiogenesis in tumours and to treat disease, critical limb ischaemia or coronary disease. Antagonists of the sequences are used to inhibit angiogenesis in tumours and to treat cinflammation (where associated with increased vascular permeability), diabetic retinopathy, rheumatoid arthritis or psociasis. Agonists are also used to identify specific binding agents (potential therapeutic agents) and to raise antibodies. The antibodies are useful as therapeutic and to raise antibodies. The antibodies are useful as therapeutic of ant vavo or in viro diagnosis (including imaging) or for therapy (including when linked to e.g. a label or cytcoxin); and for immunotyping of cells, e.g. for detecting minimal residual disease or haematopoietic progenitor/stem cells. It is also contemplated that the sequences might be useful for treating a very ander ange of other diseases, alleryy; and certical, fungal or parasitic); neurodegeneration, also as contemplated that increased to the certical, fungal or parasitic); neurodegeneration, also as contemplated that increased to the certical and the certical and parasitic); neurodegeneration, also as sequence the certical and the certical and the certical and the certical and the certical and the certical and the certical and the certical and the certical and the certical and the certical and the certical and the certical and the certical and the certical and the certical and certical and certical and certical and certical and certical and certical and certical and certical and certical and certical and certical and certical and certical and certical and certical an

 The present invention relates to novel antisense oligonucleotides (ACC71728-ACC71750 and ACC80101-ACC80155) targeted to Vascular Endothelial Growth Factor Receptor-2 (VEGFR-2) nucleotide sequence, and which inhibit the expression of VEGFR-2. The oligonucleotides are useful in compositions for treating a disease or condition associated with VEGFR -2, such as hyperproliferative disorder, e.g. cancer, a disease or condition involving angiogenesis, or rheumatoid arthritis. The present sequence is human VEGFR-2

The present invention describes a method of screening for modulators of binding between a neuropilin growth factor receptor and a vascular endothelial growth factor (VEGF)—C or VEGFP—C or VEGFR—3 in the comparing the binding between neuropilin and VEGF—C or VEGFR—3 in the presence and in the absence of a putative modulator compound. Also described: (1) screening for selectivity of a modulator of VEGF-C, VEGFR—3 or neuropilin biological activity; (2) modulating growth, migration or proliferation of cells in a mammalian organism; (3) a bispecific antibody which specifically binds to a neuropilin receptor and a VEGFR—C or VEGFR—3 polypeptide; (4) modulating neuronal growth or neuronal scarring in a mammalian organism; and (5) a polypeptide comprising a fragment of a VEGFR—1 cthat binds to a neuropilin receptor. The modulators have cytostatic, noctropic, neuroprotective, vulnerary, vasciropic and cardiant activities. The method is useful in modulating angiogenic processes and certivities. The method is useful in modulating angiogenic processes and modulating system growth and function, such as in the treatment of cancer, wound, ischaemia, cerebral infarction/bleeding, Alzheimer's disease or myocardial infarction. The polypeptide comprising a fragment of a VEGFC container of a neuropilin receptor, is useful for manufacturing a very processes or that binds to a neuropilin receptor, is useful for manufacturing a
 in
 Screening for modulators of neuropilin and vascular endothelial growth factor (VEGF)-C or VEGFR-3 interactions, comprises comparing interaction of neuropilin and VEGF-C or VEGFR-3 in the presence and absence of a
 medicament for the treatment of diseases characterised by aberrant growth, migration or proliferation of cells that express a neuropilin receptor. The present sequence represents human VEGFR-2, which is used

 The present sequence is the protein sequence of human vascular endothelial growth factor receptor-2 (VEGFR2 or KDR). A claimed DNA vaccine effective for eliciting an immune response against proliferating endothelial cells comprises a DNA construct operably encoding a VEGF receptor protein (e.g. KDR) in a carrier. The DNA construct may be a naked DNA construct or incorporated into a plasmid vector or into an attenuated bacterial vector such as attenuated Salmonella typhimurium. The DNA vaccine is used in claimed methods of inhibiting endothelial cell proliferation, inhibiting angiogenesis, and inhibiting tumour growth
 9
 New DNA vaccine for eliciting an immune response against proliferating endothelial cells comprising a DNA construct operably encoding a VEGF receptor protein in a carrier, useful for inhibiting tumor growth or anglogenesis.

 The present invention relates to a method for identifying a ligand (L), which binds to an inactive conformation of target protein kinase (T). The method involves contacting inactive conformation of (T), which contains or is modified to contain a reactive group at or near a binding site of interest, with one or more ligand candidates capable of covalently bonding to the reactive group thus forming a kinase-(L) conjugate (C). The method is useful for identifying protein kinase inhibitors that the present sequence is a protein kinase which may be modified via an amino acid substitution, for use in the method of the invention.

 The invention relates to a novel method for determining whether a test compound inhibits tyrosine kinase activity in a mammal comprising measuring in the mammal the level of at least one of the proteins and/or mRNA transcriptor genes for such proteins comprising type 1 plasminogen activator inhibitor (PAI-1), TIMP-1 (tissue inhibitor of metalloproteinase 1), vinculin, vascular endothelial growth factor (VEGF), placental growth factor (WEGF), placental growth factor (MIG), exposing the mammal to the test compound and then measuring in the mammal the level of at least one of the proteins and/or mRNA transcripts previously measured. The method of the invention may be useful to determining whether a test compound inhibits tyrosine kinase activity in a mammal. The current sequence is that of the tyrosine kinase activity inhibition-related protein of the
 Determining whether a test compound inhibits tyrosine kinase activity in a mammal by exposing the mammal to the test compound and measuring in the mammal the level of at least one of the measured proteins or mRNA

 The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single mucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's connected risk for myocardial infarction in the individual. The invention further comprises: an isolated nucleic acid molecule comprising at least contiguous nucleotides where one of the nucleotides is an SNP given in further comprision or its complement and encoding any one of the amino acid sequence given in the specification; an isolated polypeptide contains an amino acid sequence given in the specification; an antigen-binding comprising an amino acid sequence given in the specification and which is between about 16 and 1000 nucleotides in comprising an amplified polymucleotide containing an SNP given in the specification and which is between about 16 and 1000 nucleotides in concluding an SNP in a nucleic acid molecule; and an enzyme; a method of detecting an SNP in a nucleic acid molecule; a method of detecting a variant polypeptide; and a nucleic acids of the invention may be used in gene therapy. The nucleic acids of the invention may be used in gene therapy. The nucleic acids of the invention may be used in gene therapy. The composition for treating or preventing myocardial infarction. This sequence represents the protein of a human myocardial infarction. This sequence was not shown in the specification. The sequence has come from a electronic sequence listing downloaded from the NIPO website.

 The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual. The invention further comprises: an isolated nucleic acid molecule comprising at least 8 contiguous nucleotides where one of the nucleotides is an SNP given in

TO THE PARTY.

the specification or its complement and encoding any one of the amino acid sequences given in the specification; an isolated polypeptide comprising an amino acid sequence given in the specification; an antibody that specification amino acid sequence given in the specification and which is between about 16 and 1000 nucleotides in the specification and which is between about 16 and 1000 nucleotides in the length; a kit for detecting an SNP in a nucleic acid, comprising the polymucleotide, a buffer and an enzyme; a method of detecting an SNP in a nucleic acid molecule; a method of detecting an SNP in a mucleic acid molecule; a method of detecting a variant polypeptide; and a method for identifying an agent useful in treating or preventing:

The nucleic acids of the invention may be used in gene therapy. The myocardial infarction. The novel detection method has cardiant activity.

The nucleic acids of the invention may be used in gene therapy. The appropriate is useful in identifying an individual who has an increased or decreased risk for developing myocardial infarction and for preparing a composition for treating or preventing myocardial infarction. This sequence represents the protein of a human myocardial infarction. Note: This sequence was not shown in the specification. The sequence has come from a electronic sequence listing downloaded from the MIPO website. 480 480 54 Q 180 240 240 300 360 DQGLYTCAASSGLMTKKNSTFVRVHEKPFVAFGSGMESLVEATVGERVRIPAKYLGYPPP 360 420 120 420 540 9 9 99 9 VLERVAPTITGNLENQTTSIGESIEVSCTASGNPPPQIMWFKDNETLVEDSGIVLKDGNR 720 661 VLERVAPTITGNLENQTTSIGESIEVSCTASGNPPPQIMWFXDNETLVEDSGIVLXDGNR 720 WIMPNNQSGSEQRVEVTECSDGLFCKTLTIPKVIGNDTGAYKCFYRETDLASVIYVYVQD 120 KLVLNCTARTELNVGIDFNWEYPSSKHQHKKLVNRDLKTQSGSEMKKFLSTLTIDGVTRS 300 9 9 MESKVLLAVALWLCVETRAASVGLPSVSLDLPRLSIQKDILTIKANTTLQITCRGQRDLD SKKGFTIPSYMISYAGMVFCEAKINDESYQSIMYIVVVVGYRIYDVVLSPSHGIELSVGE 181 SKKGFTIPSYMISYAGMVFCEAKINDESYQSIMYIVVVVGYRIYDVVLSPSHGIELSVGE **EIKWYKNGIPLESNHTIKAGHVLTIMEVSERDTGNYTVILTNPISKEKQSHVVSLVVYVP** PCEEWRSVEDFQGGNKIEVNKNQFALIEGKNKTVSTLVIQAANVSALYKCEAVNKVGRGE PCEEWRSVEDFOGGNKIEVNKNOPALIEGKNKTVSTLVIQAANVSALYKCEAVNKVGRGE YRSPFIASVSDQHGVVYITENKNKTVVIPCLGSISNLNVSLCARYPEKRFVPDGNRISWD KLVLNCTARTELNVG1DFNWEYPSSKHQHKKLVNRDLKTQSGSEMKKFLSTLT1DGVTRS DOGLYTCAASSGLMTKKNSTFVRVHEKPFVAFGSGMESLVEATVGERVRIPAKYLGYPPP EIKWYKNGIPLESNHTIKAGHVLTIMEVSERDTGNYTVILTNPISKEKQSHVVSLVVYVP PQIGEKSLISPVDSYQYGTTQTLTCTVYAIPPPHHIHWYWQLEEECANEPSQAVSVTNPY POIGEKSLISPVDSYOYGTTOTLTCTVYAIPPPHHIHWYWQLEEECANEPSQAVSVTNPY RVISFHVTRGPEITLQPDMQPTEQESVSLWCTADRSTFENLTWYKLGPQPLPIHVGELPT PVCKNLDTLWKLNATMFSNSTNDILIMELKNASLQDQGDYVCLAQDRKTKKRHCVVRQLT Gaps ö Score 7092; DB 8; Length 1356; Pred. The present invention relates to a method for detecting cancer in a patient. The method comprises detecting in a biological sample from the patient a nucleotide or protein sequence comprising a sequence that is at least 80% identical to a nucleotide sequence (ADR4658-ADR46645) or protein sequence (ADR46646-ADR46703). The method is useful for detecting cancer for preparing a composition for diagnosing or treating cancer.

A STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STATE OF THE STA

This invention relates to the novel crystalline structure of a vascular endothelial growth factor receptor (VEGFR) peptide-ligand complex, where the protein co-ordinate data is provided. Specifically, it refers to using X-ray diffraction techniques to provide structural information about the VEGFR kinase domain (VEGFRKD) and identify a ligand binding pocket and activation loop as defined in the specification. The present invention describes using this information to identify potential VEGFR modulators, as well as designing potential modulators using rational drug design and the three-dimensional structural information that will be able to bind to and modulate the activity of this protein. In particular, it identifies potentially important atoms and contributory amino acids by ansing root mean square deviation to highlight atoms that are within 1.25 Angstroms of the Invention. 240 240 300 120 121 YRSPFIASYSDQHGVYZITENKNKTVVIPCLGSISNLAVSLCARYPEKRFVPDGNRISWD 180 180 241 KLVLNCTARTELAVGIDFNWEYPSSKHQHKKLVNRDLKTQSGSEMKKFLSTLTIDGVTRS 300 360 301 DQGLYTCAASSGLMTKKXSTFVRVHEKPFVAFGSGMESLVEATVGERVRIPAKYLGYPPP 360 WIMPINGSGSEORVEVTECSDGLFCKTLTIPKVIGNDTGAYKCFYRETDLASVIYVYVQD 120 9 9 PCEEMRSVEDFQGGNKIEVNKNQFALIEGKNKTVSTLVIQAANVSALYKCEAVNKVGRGE 181 SKKGFTIPSYMISYAGMVFCEAKINDESYQSIMYIVVVVGYRIYDVVLSPSHGIELSVGE KLYLNCTARTELAVGIDFNWEYPSSKHOHKKLVNRDLKTOSGSEMKKFLSTLTIDGVTRS 61 WLWPINNQSGSEQRVEVTECSDGLFCKTLTIPKVIGNDTGAYKCFYRETDLASVIYVYVQD EIKWYKNGI PLESNHTI KAGHVLTIMEVSERDTGNYTVILTNPI SKEKQSHVVSLVVYVP Crystalline structure for identifying potential vascular endothelial growth factor receptor (VEGFR) modulator, of VEGFR peptide and ligand 1 MESKVILLAVALWLCVETRAASVGLPSVSLDLPRLSIQKDILTIKANTTLQITCRGQRDLD SKKGFTIPSYMISYAGMVFCEAKINDESYQSIMYIVVVGYRIYDVVLSPSHGIELSVGE DOGLYTCAASSGLMTKKNSTFVRVHEKPFVAFGSGMESLVEATVGERVRIPAKYLGYPPP EIKWYKNGI PLESNHTI KAGHVLTIMEVSERDTGNYTVILTNPI SKEKQSHVVSLVVYVP POIGEKSLISPVDSYQYGTTQTLTCTVYAIPPPHHIHWYWQLEEECANEPSQAVSVTNPY RVISFHYTRGPEITLQPDMQPTEQESVSLWCTADRSTFENLTWYKLGPQPLPIHVGELPT Gaps ö Score 7092; DB 8; Length 1356; Pred. The invention relates to the use of a protease with defined specificity for a target substrate for preparing a medicament for the treatment of a specific disease related to the target substrate. The invention also relates to a pharmaceutical or diagnostic composition comprising one or relates to a pharmaceutical or diagnostic composition comprising one or diagnostically acceptable carriers, excipients and/or auxiliary agents, contacting the target substrate in vivo or in vitro comprising contacting the target substrate with a protease as cited in the use mentioned, and a method for treatment of a disease in a patient connected with a specific target substrate comprising administering to the patient a protease with defined specificity for the specific target substrate or reduces or more biological activities, physico-chemical properties or her patient a protease hydrolyzes the target substrate and eliminates or reduces one or more biological activities, physico-chemical properties or increases one or more biological activities, physico-chemical properties or increases one or more biological activities, physico-chemical properties or the target protein, and/or adds one or or pharmacological activities of the target protein, and/or adds one or more biological activities of the target protein. The protease may be administered to treat immune disorders, inflammatory disorders, nematological diseases, cardiovascular diseases, neurological diseases, neurological diseases, cardiovascular diseases, neurological diseases, neurological diseases, cardiovascular diseases, neurological diseases, neurological diseases, neurological diseases, neurological diseases, cardiovascular diseases, neurological diseases, neurological diseases, neurological diseases, neurological diseases, neurological diseases, neurological diseases, neurological diseases, neurological diseases, neurological diseases, neurological diseases, neurological diseases, neurological diseases, neurological diseases, neurological diseases, neurological diseases

 The invention relates to a method of treating a patient diagnosed with cat risk for developing a neovascular disorder, or suppressing a neovascular disorder in a patient. The method is useful for treating a patient diagnosed with or at risk for developing a neovascular disorder or suppressing a neovascular disorder, a patient. The neovascular disorder is an ocular neovascular disorder, is section to the match, irisk arthritis. The ocular neovascular disorder is ischemic retinopathy, irisk
 Treating an ocular neovascular disorder, comprises administering a platelet derived growth factor antagonist and a vascular endothelial growth factor antagonist, simultaneously or within ninety days of each

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence represents the TEK protein, also known as TIEZ protein. TEK is a receptor tyrosine kinase. TEK contains epitopes which bind to MHC. The presentation of TEK epitopes can also stimulate helper cell and/or cytotoxic T cell responses. The immune response is directed against endothelial cells in the tumor-associated vasculature and consquiation and thrombosis. The immune response is targeted to coagulation and thrombosis. The immune response is targeted to coagulation and thrombosis. The immune response is targeted to conforthelial cells lining blood vessels of the tumor (these cells overexpress Tek), so damage to even a few cells will kill many tumor cells are accessable to the immune response and problems of antigenic heterogeneity, MHC loss and resistance to apoptosis (associated with epithelial cells) are unlikely to occur in normal condothelial cells. Tek spitopes (see AAX10320-24) are used to generate antibodies, and for prevention and treatment of cancer. The peptides, and recombinant DNA constructs or viral vectors that express them, are useful as anticancer vaccines to target endothelial cells that line blood

The invention relates to a crystalline polypeptide, comprising the catalytic domain of a receptor tyrosine kinase Tie-2 protein. The crystalline forms are useful for identifying inhibitors of a Tie-2 protein as well as determining the three dimensional structure of a the catalytic domain of a Tie-2 polypeptide. A Tie-2 inhibitor may be used to treat a Tie-2 dependent condition in a patient (especially a human), where the condition is characterized by excessive vascular proliferation e.g. a hyperproliferative disorder, cancer (e.g. sarcoma, osteoma, nelanoma, lymphoma, and leukemia), a cardiovascular condition (e.g. anteroscierosis, ischemia, anemia, and vascular leakage disorders), an cular condition (myopia, chronic retinal detachment, conjunctivitis, certinopathy, and macular degeneration), von Hippel Lindau disease, pemphigoid, psoriasis, Paget's disease, polycystic kidney disease, pemphigoid, psoriasis, Paget's disease, polycystic kidney disease, chronic inflammation, synovitis, inflammatory bowel disease, Crohn's chemic inflammation, synovitis, inflammatory bowel disease, Crohn's chemic or sepsis, especially where the disorder involves aberrant endochelial interactions. The Tie-2 inhibitor may be used to decrease fertility, and promote angiogenesis or vasculogenesis (in combination with a pro-angiogenic growth factor). The present sequence

 Composition for the design or screening of a cytoplasmic Tie2 receptor tyrosine kinase domain modulator, comprises a monoclinic or orthorhombic crystalline form of a cytoplasmic Tie2 receptor tyrosine kinase domain polypeptide.
 09
 9
 This invention relates to the 3 dimensional crystal structure of the human Tie2 receptor tyrosine kinase domain polypeptide in a monoclinic, or orthorhombic crystalline form. Tie2 is an endothelial-specific receptor tyrosine kinase thought to be involved in vascular development. Naturally occuring R849W and Y897S mutations in the Tie2 protein have been identified in human s and have been shown to segregate with the autosomal dominant condition vascular dysmorphogenesis. The invention also comprises methods for designing modulators of the biological activity of the cytoplasmic Tie2 receptor tyrosine kinase domain. The Tie2 receptor tyrosine kinase domain is used to design or screen for a modulator of the kinase by rational drug design, using computer models. The present sequence represents the human Tie2 protein used to create th Tie2K tyrosine kinase domain of the invention

ABB85003. The PRO proteins and polynucleotides have cardiant, cytostatic, antiangiogenic, hypotensive, vulnerary and antiarteriosclerotic activities, and can be used in gene therapy. The PRO polynucleotides, proteins, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO polynucleotides have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. ABU88259 to ABL88267 represent primers and probes used in the exemplification of the present invention

 The present invention provides the protein and coding sequences of human cardiovascular. These are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, mycoardial infarctions, thrombophlebitis, lymphangitis, tunmour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The present sequence is a PRO protein of the invention

The present invention relates to methods and compositions for detecting an angiogenesis-associated transcript in a cell in a patient. The method involves contracting a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence at least 80% identical to any of the angiogenesis-associated human polymucleotide sequences given in the specification. These angiogenesis-associated polymucleotide sequences comprise genes that exhibit changes in expression levels as a function of time in tissue undergoing capressis. The method and the polymucleotide sequences of the invention are useful for diagnosing and treating angiogenesis and angiogenesis-associated diseases e.g. cancer. The polymucleotide sequences concerned in the gene therapy of such disorders. The sequences are also useful in the gene therapy of such disorders. The sequences are also useful in the gene therapy of such disorders. The sequences are useful as a vaccine for therapeutic and prophylactic immunisation. ABU03456-ABU03569 represent anglogenesis-associated disorders are useful as a vaccine for therapeutic and prophylactic immunisation.

 The invention describes a method of identifying a modulator of binding between a Tie receptor tyrosine kinase and an Ephrin ligand. The method composition in the presence and in the absence of a putative modulator composition in the presence and in the absence of the putative modulator. The method is useful for identifying a modulator of binding between a Tie receptor and the Ephrin tyrosine kinase and an Ephrin ligand. Modulators identified from the cyrosine kinase and an Ephrin ligand. Modulators identified from the tyrosine kinase and an Ephrin ligand. Modulators identified from the cyrosine kinase and an Ephrin ligand. Modulators identified from the tyrosine kinase and an Ephrin ligand. Modulators identified from the cyrosine kinase and an Ephrin ligand. Modulators identified from the tyrosine kinase and an Ephrin gasease associated with aberrant Ephrin-compound, aberrant growth, migration or proliferation of calls that express a Tie receptor, or for promoting growth of vessel or cheomic compound, or a tissue graft or transplant). This is the amino character of human Tie receptor tyrosine kinase 2 (Tie 2)

 transmembrane polypeptide (PRO). The nucleic acid encoding a secreted and transmembrane polypeptide (PRO). The nucleic acid, a polypeptide encoded by the nucleic acid, or an agonist or antagonist, is used to treat a cardiovascular, endothelial, or angiosenic disorder in a mammal. preferably a human. The human may have suffered a myocardial infarction or has cardiac hypertrophy, trauma, a cancer, or age-related macular degeneration. The cardiac hypertrophy is characterised by the presence of an elevated level of PGF-2 alpha. A PRO polypeptide, given in the specification, or an agonist is used to induce cardiac hypertrophy. PRO1376 or PRO1499 is used to stimulate angiogenesis. PRO4302 or an agonist is used to induce andothelial cell apoptosis. A PRO polypeptide, given in the specification, or an agonist is used to induce endothelial cell upoptosis. A propartrophy endother south muscle cell growth, or to induce endothelial cell tube formation. The present sequence represents the amino acid sequence of a PRO polypeptide of the invention.

 The present invention relates to a method for identifying a ligand (L), which binds to an inactive conformation of target protein kinase (T). The method involves contacting inactive conformation of (T), which contains or is modified to contain a reactive group at or near a binding site of interest, with one or more ligand candidates capable of covalently bonding to the reactive group thus forming a kinase-(L) conjugate (C). The method is useful for identifying protein kinase inhibitors that preferentially bind to inactive conformation of a target protein kinase. The present sequence is a protein kinase which may be modified via an amino acid substitution, for use in the method of the invention.

preferably a human. The human may have suffered a myocardial infarction or has cardiac hypertrophy, trauma, a cancer, or age-related macular degeneration. The cardiac hypertrophy is characterised by the presence of an elevated level of PGF-2 alpha. A PRO polypeptide, given in the specification, or an agonist is used to inhibit or stimulate endothelial chypertrophy. PRO1376 or an agonist is used to induce cardiac hypertrophy. PRO1376 or PRO149 is used to stimulate angiogenesis. PRO4302 or an agonist is used to induce endothelial angiogenesis polypeptide, given in the specification, or an agonist is used to stimulate or inhibit smooth muscle cell growth, or to induce endothelial cell tube formation. The present sequence represents the amino acid sequence of a PRO polypeptide of the invention.

The invention relates to human PRO polypeptides and the PRO polymucleotides encoding them. The invention also relates to treating cardiovascular, endothelial or angiogenic disorders in mammals, inhibiting endothelial or angiogenic disorders in mammals, inhibiting endothelial or angiogenic disorders in properties of the invention or smooth muscle cell growth by administering polypeptides of the invention. The PRO polypeptides and polymucleotides are useful for treating cardiovascular, endothelial or angiogenic disorders, e.g. myocardial infarction, cardiac hypertrophy, trauma, cancer or age-related macular degeneration. The PRO polymucleotides are useful as hybridisation probes in chromosome and gene mapping and in geneting antiennes RNA and DNA, and for chromosome identification and issue typing. The PRO polypeptides and polymucleotides are also useful in gene therapy and as molecular weight markers for protein clectrophoresis purposes. This sequence represents a human PRO polypeptide of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at

protein-tyrosine kinase (EC 2.7.1.112), receptor type tie precursor - human C;Species: Homo sapiens (man)
C;Species: Homo sapiens (man)
C;Accession: S24066; C38269; I52613
R;Partanen, J.; Armstrong, E.; Maekelae, T.P.; Korhonen, J.; Sandberg, M.; Renkonen, R.; Mol. Cell. Biol. 12, 1698-1707, 1992
A;Title: A novel endothelial cell surface receptor tyrosine kinase with extracellular epi A;Reference number: S24066; MuID:92195316; PMID:1312667
 R; Partanen, J.; Maekelae, T.P.; Alitalo, R.; Lehvaeslaiho, H.; Alitalo, K. Proc. Natl. Acad. Sci. U.S.A. 87, 8913-8917, 1990
A;Title: Putative tyrosine kinases expressed in K-562 human leukemia cells.
A;Reference number: A38268; MUID:91062389; PMID:2247464
A;Accession: C38269
A;Accession: C38269
 R;Korhonen, J.; Lahtinen, I.; Halmekyto, M.; Alhonen, L.; Janne, J.; Dumont, D.; Alitalo, Blood 86, 1828-1835, 1995
A;Title: Endothelial-specific gene expression directed by the tie gene promoter in vivo. A;Reference number: 152613; MUID:95383653; PMID:7655012

## SUMMARIES

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sato T.N., Qin Y., Kozak C.A., Andus K.L.;
Tie-1 and tie-2 define another class of putative receptor tyrosine kinase genes expressed in early embryonic vascular system.";
Proc. Natl. Acad. Sci. U.S.A. 90:9355-9358(1993).
I- FUNCTION: This protein is a protein tyrosine-kinase transmembrane receptor for angiopoietin 1. It may constitute the earliest mammalian endothelial cell lineage marker. Probably regulates endothelial cell proliferation, differentiation and guides the formation.

Example 1. Example 1. Example 1. Example 1. Example 2. Example 2. Example 2. Example 3

 This Swiss-Prot entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL Outstation the European Bioinformatics Institute. There are no restrictions on its use as long as its content is in no way modified and this statement is not
 Dumont D.J., Yamaguchi T.P., Conlon R.A., Rossant J., Breitman M.L.,
"Tek, a novel tyrosine kinase gene located on mouse chromosome 4, is
expressed in endothelial cells and their presumptive precursors.";
Oncogene 7:1471-1480(1992).
-!- FUNCTION: This protein is a protein tyrosine-kinase transmembrane
receptor for angiopoietin 1. It may constitute the earliest
mammalian endothelial cell lineage marker. Probably regulates
endothelial cell proliferation, differentiation and guides the
proper patterning of endothelial cells during blood vessel
formation.
 CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + a protein tyrosine phosphate.

SUBCELLULAR LOCATION: Type I membrane protein.

TISSUE SPECIFICITY: Specifically expressed in developing vascular endothelial cells. Abundantly expressed in lung and heart, andorately in brain, liver and kidney, and weakly in thymus, spleen and testis.

DEVELOPMENTAL STAGE: Expression detectable in day 8.5 embryos.
 "Molecular cloning and characterization of mouse TIE and TEK receptor tyrostne kinase genes and their expression in hematopoietic stem cells.";
Biochem. Biophys. Res. Commun. 195:301-309(1993).
 SIMILĀRITY: Contains 3 EGF-like domains.
SIMILĀRITY: Contains 3 fibronectin type-III domains.
SIMILĀRITY: Contains 2 Ig-like C2-type (immunoglobulin-like)
domains.

 tyrosine phosphate.

SUBCELLULAR LOCATION: Type I membrane protein.

SUBCELLULAR SPECIFICITY: Expressed in most populations of endothelial cells in 24 hours embryos. Not present in intersegmental vessels SIMILARITY: Belongs to the Tyr protein kinase family. Tie
 Dev. Dyn. 212:133-140(1998).

-I- FUNCTION: Probably regulates endothelial cell proliferation, differentiation and guides the proper patterning of endothelial cells during blood vessel formation (By similarity).

-I- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + a protein
 MEDLINE-99264593; PubMed-9603430; DOI-10.1002/(SICI)1097-0177(199805)212:14:133::AID-AJA12>3.3.CO;2-3; DOI-10.1002/(SICI)1097-0177(199805)212:14:133::AID-AJA12>3.3.CO;2-3; Lyong M.S., Bell B., Stainler D., Peters K.G.; "Isolation of the zebrafish homologues for the tie-1 and tie-2 endothellum-specific receptor tyrosine kinases.";
 MAQAFQNVREEPAVQFNSGTLALNRKVKNNPDPTIYPVLDWNDIKFQDVIG 788
 SIMILARITY: Contains 3 EGF-like domains.
SIMILARITY: Contains 3 fibronectin type-III domains.
SIMILARITY: Contains 2 Ig-like C2-type (immunoglobulin-like)
